The Hidden Curriculum of the Econ Job Market

by *Javier Gonzalez* — (website) — (latest version) — 2026-03-02

Despite the abundance of guides, webinars, and official resources, I found that much of the advice available was shaped by pre-COVID experiences or tailored to candidates from top-ranked institutions. These "hidden curriculum" elements include not just the logistics of applications and interviews, but also the subtle expectations, networking strategies, and unspoken norms that can make a significant difference in outcomes. My goal here is to complement the current advice with the experience of a candidate from a lower-ranked school.

Take the advice in this document with a grain of salt, as this is my personal experience on the job market in the 2025-26 cycle as a Ph.D. Economics Candidate from Southern Methodist University.

I found the following resources particularly helpful:

- *A Guide and Advice for economists on the U.S. Junior Academic Job Market 2018-2019* by John Cawley (outdated but with usefull information)
- AEA Prep. Job Market Resources
- AEA JOE Committee on the Job Market videos and documents
- EJM Informational discussions and webinars
- European Job Market for Economists (EJME) with Guides for Candidates and workshops

Housekeeping The advice in the *Advice* sections are in no particular order.

I will skip the *offer bargaining* and the *market scramble* stages as I have nothing valuable to offer. Please refer John Cawley's guide and always seek advice from your advisor if you are in any of those stages.

The examples of my answers will be displayed on a *quote* block, so you can easily identify them:

> *My future research will be dedicated to expanding this methodological pipeline ...*
>
> — *Javier Gonzalez*

This document is sort of informal, so please excuse any typos or grammatical horrors and unclear phrasing.

If you have any comments or suggestions don't hesitate to contact me.

Aknowledgements Special thanks to Fernanda Da Silva for encouranging me to write down this document so that other SMU students can be more informed while navigating the job market. It also served me as a personal journal to reflect on my own experience, a way to keep my sanity, and keept me occupied in the waiting periods of each stage.

Declaration of generative AI and AI-assisted technologies During the preparation of this work the author used generative AI models (e.g. Gemini) in order to check grammar and spelling, search for related literature, and coding support. After using this tool/service,the author reviewed and edited the content as needed and take full responsibility for the content.

Preparing Applications

The econ job market is a tirering and grouling marathon.

It "starts" in the summer before the market opens (June or July), where you need to assess if you are ready for the market and if you want to participate in the next cycle. Talk with your advisor and committee members to get their feedback on your readiness.

Your Job Market Paper should be finished by August before the market. This means a *polished* draft with all pieces, figures, and tables.

In September you will start preparing the material so that you and your letter writters are ready to send hundrends of applications.

October and November will be spent on sending applications. You will have zero time to work on your JMP during this time. In my case, I just had my firstborn daughter in September, which served as a good commitment device to have everything in order before her arrival.

December is where you would have the bulk of your interviews.

By January and Febreuary you will be waiting and doing fly-outs.

Lastly, by February and March you should have some offers. And now need to decide between offers, and most likely forgo some departments that moved slower than you wanted.

This means that the actual market, not counting the preparation, lasts around **6 months**.

It is a **wierd** period, with a mix of **anxiousness** and **excitement** for all the attention your work will receive. You will be anxiously waiting for interviews, fly-outs, and then waiting for offers. You might have the opportunity to travel, but with a big job market presentation in mind. All the while you are in the middle of the end of the year holidays.[1] And depending on your application strategy, this is also a time where the world seems to be extremely open, but that comes with the uncertainty that you don't know in which country you will end up next couple of years.

So it's specially important that you find ways to stay focused. In my case, I had a newborn daugther which kept my mind occupied. But, this also meant that I couldn't exercise as much as I wanted to, which is my main way to relieve stress. Talking about what I'm thinking to my wife, helped me stay sane during this period. Journaling can also help, as this document served as a journal of my experience in the market. I would suggest you remember what were the things you did while preparing and waiting for the answers of the first year qualifiers, as you will be in a *somewhat* similar stress situation. Lastly, try to give yourself grace. In other words, do not be too hard on yourself if things do not go as planned.

You will have a bad interview, have the worst presentation of your life during a fly-out, or have not received any interview invites before mid-December. You will overthink every little detail of your application package, interview, and fly-out. Best you accept, see how can you make a minor improvement, and move on. Remember that practice makes perfect and other junior candidates are in the same boat as you are.

Advice

Your network and your advisor's network are key to get interviews. This is the time to use the network you have been building during your academic career.

Before the market[2] expand your network strategically by connecting with people who work in the markets you want to target (e.i. Associate Professors in EU if you want to target the EU market). Attend

[1] I was invited for an interview invitation on the 23th and having an interview on the 29th.

[2] Hopefully during the 3rd or 4th year of your Ph.D.

regional conferences and workshops to build relationships with faculty who can later tell the hiring committees so they *at least* take a look at your application. For example, if you want to target the Spanish market, prioritize attending the Simposio de la Asociación Española de Economía (AEE) and use that opportunity to meet potential connections in person.[3] If you are a Latin American student, consider attenting the Latin American and Caribbean Economic Association (LACEA) annual meeting.

How should you start networking at these events? Approach presenters after their talk and asking a question about their work. These naturally lead to longer conversations. You can also seek out people with similar backgrounds (for example, if you share language, culture, or even region) as a natural way to establish rapport and enter discussions.

Your advisor should be reaching out to his network in places they have connections and you have applied to. Max Erdemandi's LinkedIn post explains that recognized institutions such as Duke can have a far reach by broadcasting their candidates in LinkedIn or even in the faculty or alumni's network. For smaller or lower ranked institutions the reach is limited. This responsability now falls in your committee, specially your advisor. The best way to approach your advisor so they push for you is to be direct. Just ask:

> *"Would you be willing to reach out to your network for those institutions that I am applying to? Where do you have connections? Which ones are you willing to contact on my behalf?"*

They will then let you know if there are some limitations to who/where they can reach out. Don't forget to also reach out to MA advisor or letter writers for the Ph.D. that might be willing to help you.

Make sure your committee and/or letter writers know if you will participate on the market by **September**. *Who should be your letter writters?* Your advisor should be one of the letter writters, and you can chose the other 2 or 3 letter writers. They can be from the committee or not.

Be strategic, choose people who know you well, can write a strong letter of recommendation, and hopefully describe you in different ways. My letter writers where: (i) my advisor, (ii) a committee member who knew my research well and my work as a research assistant, (iii) and another committee member who could vouch for my teaching skills and experience.

The letter writers need time to write you a good letter, so let them know as early as September, so they can have the letters ready by mid-October. There are 3 potential ways that they can send the letters (in order of inconvenience for them):

1. They upload the letter directly to the platforms (e.g. AEA JOE, EJM, Interfolio) and you then just select them when applying to each position.[4]
2. They will send the letters to an administrator.[5] Then you would communicate with this administrator for the best way for them to send the letters. Sometimes you just replace the letter's writer email with the administrator email in the application platform. Other times, they will require to send them by email, so you will need to coordinate with the administrator to make sure they send the letters on time.
3. They send you the letters directly, and you upload them to each application. This is the most inconvenient for them, so try to avoid this if possible. Remember that professors are busy people, and during the end of the fall semester they might have many things going on.

[3] If you are an SMU student, remember that you have a budget of $1000 for conference travel with the Graduate Student Travel Grant from the Moody school.

[4] There is an option in AEA JOE and EJM where each letter writter can assign an administrator, but we found that this was cumbersome, and the best way is just to let them know where they need to upload to these platforms. Make sure they select the option to automatically send the letters to each request in these platforms.

[5] The Graduate Advisor was in charge of this at SMU at that time.

Create your academic website early. Use a ready-made template and host it on GitHub Pages to save time. Follow the academicpages guide to get a clean, professional site up quickly. Use an LLM to draft and update content instead of learning HTML and CSS from scratch. Display the essentials information in the first or landing page (e.g. CV, Job Market Paper, a one-paragraph research summary, and contact information). Keep navigation intuitive, make the site mobile-friendly, and ensure the key documents are one click away. Hiring committees skim hundreds of applications, and any small frictions can make the difference between being noticed or overlooked.

Practice JMP talk in your department, classes, conferences before the job market season starts. Each presentation helps you understand the common questions your paper raises, and will allow you to anticipate these questions, develop concise answers, and project confidence during potential interviews and fly-outs.[6] Get practice by presenting at workshops, brownbags, student seminars, conferences, and by running your talk by seminar speakers, peers, and advisors. There is plenty of material on how to create an effective research presentation, so I will not go into details here. You can find a compilation of *Advice for Phd Students in Economics* from Chris Roth and David Schindler in the topic of Presentations.

[6] In my case, my JMP raises concerns about reverse causality. The feedback I received from brownbags, workshops, and conferences led to put this concern in the first two slides to address it as quick as possible.

Applications

A typical application package includes:

1. Cover letter
2. Curriculum Vitae
3. Job Market Paper
4. Research Statement*
5. Teaching Statement*
6. Letters of Recommendation (usually 3)

** I noticed a shift that most non-US positions do not require Research or Teaching Statements. But these will come up in the interviews, so there is value in writting them.*

There is plenty of advice on how to prepare each of these documents, so I will not go into them here.

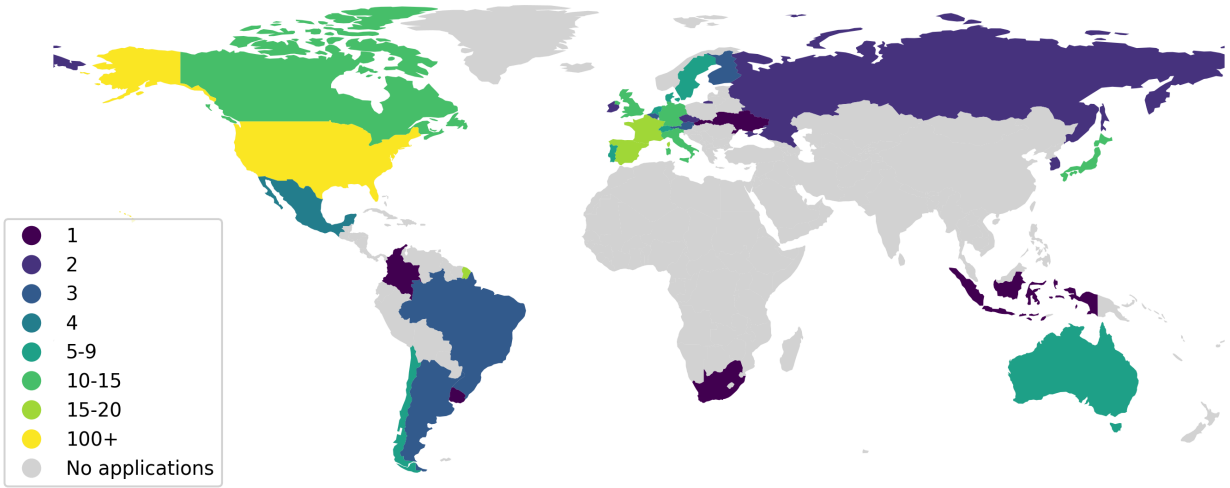
Strategy

I targeted to apply to 308 positions in total. With 198 (69.4%) for Assitant Professor (AP), 44 (16.1%) for Postdocs, and the rest a mixture of Lecturer, Industry, and Non-profit positions.

My main strategy was to apply broadly.[7] The academic economics job market is contracting (see Econ-Jobs.com and John List's post) with fewer and less predictable openings. Even when a position did not appear to be a good fit (e.g. a finance department instead of economics), I still sent an application. Many departments prefer to hire an outstanding candidate even if they are expert of another related field. Figure 1 shows the geographical distributions of applications of my applications. I sent 140 applications to institutions in the U.S. and LATAM (51.5%) , 111 (40.8%) to Europe, 13 to Asia (predominatly Japan), 7 to Australia, and 1 to South Africa.[8]

Applications take time. Start early and be organized, specially if you are also targeting 250+ applications. Figure 2 shows the number of applications I sent each day (right axis) and the cummulative timeline of my applications (left axis). I started to work on application materials in early September and sent my first batch of applications by mid-October. You can see that I had days with 10+ applications sent, these were mostly 8 hours of applications with around 10 applications only using the AEA JOE

Figure 1: Geographical distribution of my applications



[7] This was also the advice from almost everyone I talked to, including my advisor.

[8] I purposely avoided applying to any job postings in China and the Middle East. These are places I wouldn't want to move to even if I got the offer.

or EJM platforms.[9] However, some institutions also require you to send the application through their own platform, which can be time consuming as you need to re-upload all documents and fill in personal information again.

Create a LinkedIn profile! This will make it easier to autofill some of the personal information required in some of these platforms.

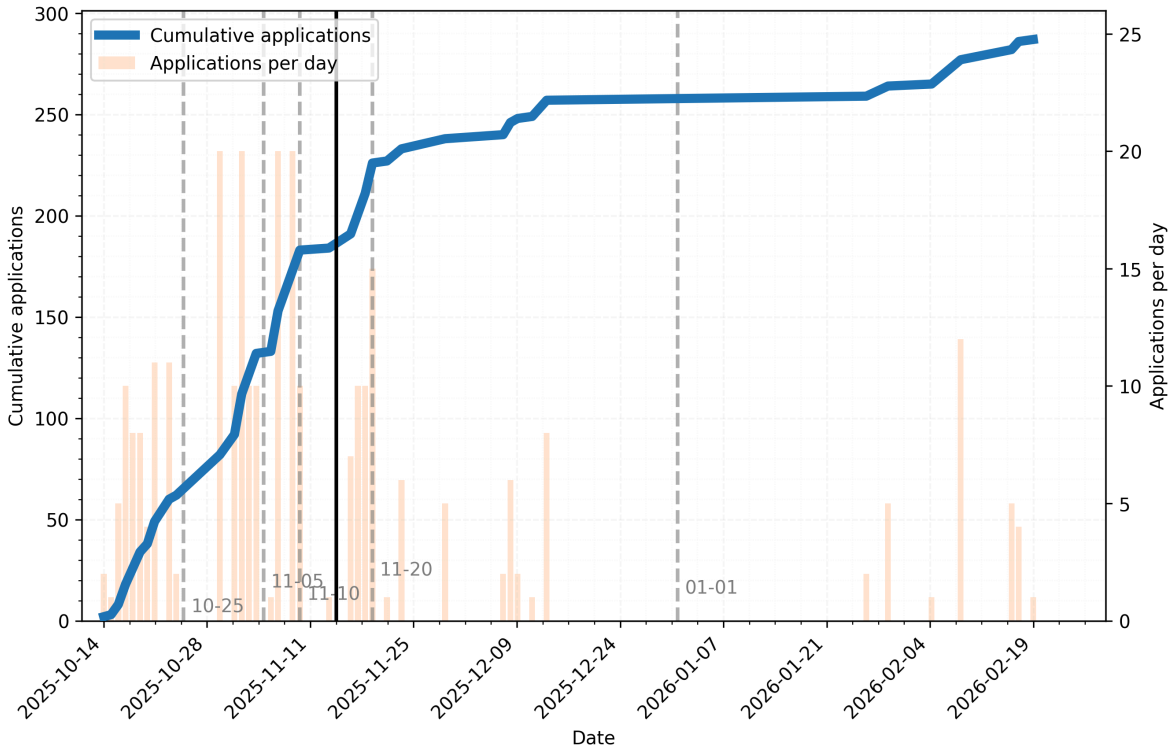
The most important deadline for applications is November 15 (solid black line), as many departments have this as their target deadline.[10] I also set up my own target deadlines (grey dashed vertical lines) to have batches of applications ready. The idea is that you target 2-5 days before the advertized target deadline just have some leeway in case of technicals issues in the application procedures.

It is important that you constantly send applications. Check both EJM and AEA JOEevery couple of weeks for new positions. Even with the busy interview/fly out season of January and February, new positions for post-docs and stagered AP positions can pop up. As you can see in Figure 2, I took a brake of application in January, and in hindsight it was a mistake. However, I did restart the applications in Late January and Early February.[11] In my case, the position which ultimatly offer me a job was from a postdoc position that I found in February.

Set-up

I used `vscode` to generated *personalized* documents using `python` and allowed me to modify/export the documents with `typst`. You can think of `typst` as a LaTeX replacement with modern syntax and instant preview (no need to compile the `.typ` file everytime you want to see a change).

Figure 2: Application Timeline



Notes: The grey vertical lines represent the target deadlines that I sent myself to have a batch of apps ready. The most important deadline is November 15 represented by the solid black line.

[9] These platforms make the application process easier as you can upload all your documents once and then just select them for each application.

[10] This is because most departments, US and EU, go over applications in Thanksgiving break aiming to hold interviews on mid-December.

[11] The main trigger for this was an awesome AP position in LATAM that I ended up beign a runner up for the offer.

My set up can be devided into 3 main components:

1. Gather info about job add, department, and school/project if it is a post doc
   - This can be time consuming as you might want to read faculty pages, so take it into consideration
2. Let a LLM read the addition information + CV to create a single paragraph to be at the end of the Cover letter to indicate fit with the position
3. Use `typst` to modify the cover letter template
   - Make sure you get the position + institution right
   - add personal reasons to apply to that position
   - Modify the LLM generated paragraph to make it more personal

If you want to see my full set-up please check this repo, in particular the `personalize_docs.ipynb` notebook.

Keep a `.txt` file with all the extra information you will always copy and paste. In this repo the file is `other_docs/other_info.txt`.

Advice

In your cover letter always emphasize the fit with the postion. In other words, you need to tailor the cover letter to each position. Personal reason here are very important. Do not be afraid to **bold** the key phrases that you want the committee to remember about you. Examples:

> *As a Spanish national, my family and I are eager to **return to Europe** so our newborn daughter can grow up immersed in European culture. We are seeking a community with a safe learning environment, a key factor in our decision to **leave the United States**.*

> *My wife, who is Mexican, and I, a Chilean citizen, are eager to **return to our roots in Latin America**. We want our newborn daughter to grow up immersed in the culture, and our search for a safe learning environment for her is the primary motivation for our move from the United States.*

> *My family and I are eager to **leave the United States**. We want our newborn daughter to grow up in a different cultural environment and are seeking a community with a safe learning environment. We are also **willing to learn Japanese** as soon as possible to better integrate into the local culture and academic community*

IMPORTANT: If you are female, you have to think through if you want to disclose family information in your cover letter, interviews, and fly-outs. In my case, a family signaled that I wanted to leave the US and find a career elsewhere with my starting family, where most people in the search committee can relate with. Some people who will read the same phrase for a female candidate might think that she will need tenure clock extension or maternity leave in the near future, which might potentially hurt your chances.

You do not need to tailor your Teaching or Research statements. Many non-U.S. positions do not even request them. I personalized mine, but in practice hiring decisions tend to hinge more on the Job Market Paper and your interview performance, where these topics will surface naturally.

However, you should put effort in preparing these documents. The research statement helps you clarify your research agenda and future plans, while the teaching statement allows you to reflect on your teaching philosophy and experience. Both of these topics **will** come up in your interviews.

Use your **signals**. Remember that you have 2 signals for the AEA JOE and 10 signal for the EJME. The common advice here is that you send a signal where your committee does not know anyone and

that you think there is a chance they will hire you. In other words, do not waste your signals in MIT, Harvard, Chicago, or top in EU.

That said, I don't know if they did anything for me. No institutions I sent my signals to invited me to interview, which is either I send the wrong signals or these particular institutions don't care that much about them. David Schindler stated that European institutions do pay attention to the EJME signals.

On the EJM you can link a 1-minute JMP spiel. I uploaded one and it received about 60 views, with over 70% of the views coming from a link in the frontpage of my website. That exposure generated *some* engagement and the exercise forced me to refine and rehearse a concise 1-minute presentation, which is valuable practice for interviews.[12]

Unless you have accepted an offer, do not stop applying to positions. As you can see in Figure 2, I took a brake of application in January, but I tried to restart it in February. In February, I found a postdoc position that could have been a good match, but by february the January deadline passed.

Waiting

Resist the urge to check EconJobRumors! You might cave once, but anonymous posts cannot be verified, and small rumours often spiral out of control making ALL candidates anxious.

Focus instead on more "reliable" sources.

Econtrack can be informative for AEA JOE listings, but it can sometimes unreliable because any user can upload a status change. Do not treat its updates as definitive unless an entry is explicitly "verified by an official of this institution".

The EJM status updates tend to more reliable and can give you a useful signal about where a search stands for a particular position. For example, when a job shows "Interview scheduling completed" status it usually means the committee will not send out more interview invitations. If you see that status and have not received an invitation, there is a high probability you did not make the cut.

At the same time, a visible "Scheduling interviews" without an invitation is likewise a strong signal you did not make the cut.

Some postings remain in "Reviewing applications" for long periods, and does not necessarily imply will send interview invites soon. As an example, I received a postdoc interview invite from an institution whose EJM status remained in "Reviewing applications" until January.

The most reliable information is to ask if your advisor if they have a **close connection** in the institution you want to know and they are willing to ask around.

Most positions will not give you any news. I did not receive any updates from 92% of my applications. So if you get to mid-December and the application target deadline has long passed, it is likely that you did not make it to the interview stage.

What if you don't hear anything after mid-December? In the 2025-26 cycle, the European Job Market for Economists (EJME) urged departments to conduct virtual interviews between December 15 and December 18. The AEA JOE Committee recommended that interviews should be held after December 3, when the signal went out. Therefore, it is likely you did not make it to the interview stage in this first round.

This does not mean that you are doomed!

There are 3 reasons why you can still have a chance. First, the timeline is a little different for postdoc positions. Some might want to wait for the AP positions to finish their matching, so they can pick from the remaining candidates. They have the incentive to do this since in general an offer from a AP position

[12] A viewer appreciated that the video connected to my AI methodology.

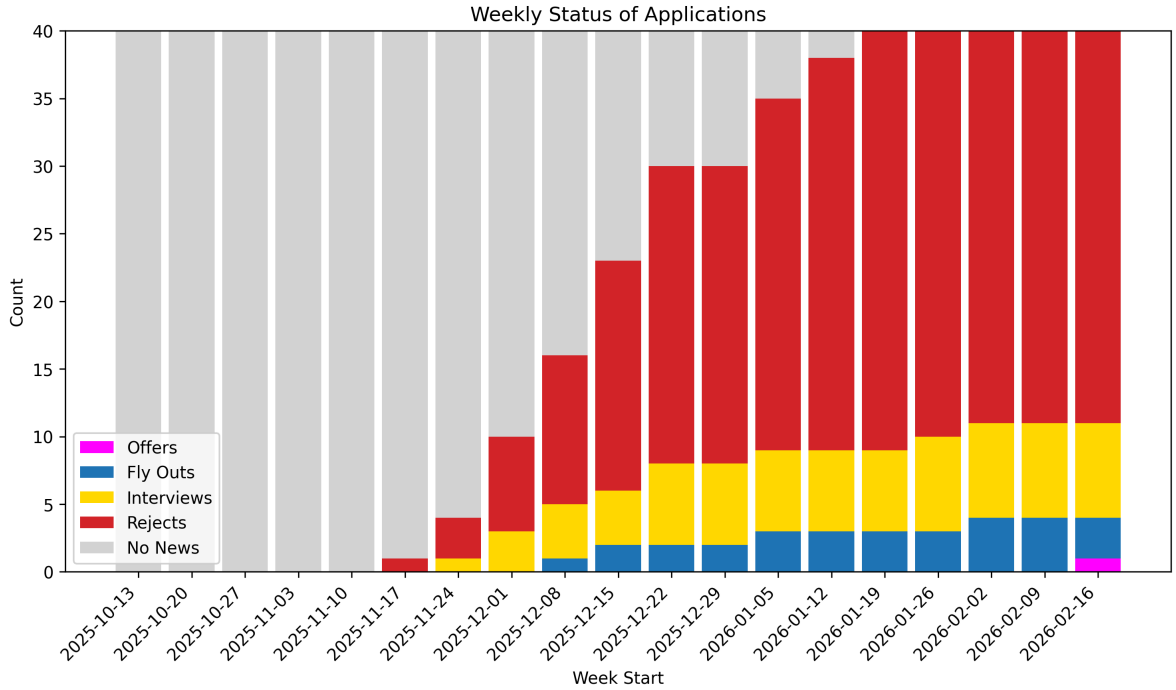
is more attractive than a postdoc for candidates. Second, some institutions also wait to send their interview invites. These departments have a similar incentive as postdocs, since an offer from a higher ranked institution is more attractive. Third, there is a market scramble where unmatched institutions and candidates can find each other in March. Remember that you need to register to participate in the scramble so be on the lookout for the registration dates.[13]

[13] For the year 2025, the scramble registration for both institutions and candidates was March 6-12.

Interviews

I got my first interview invite at the end of November for an Assistant Professor (AP) position in LATAM. In total, I have received 13 interview invites (5 AP, 7 Postdoc, 1 Consulting). That means that only 13 out of my 308 applications (4.2%) resulted in an interview.[14] I participated in five interviews virtually in December before the holiday break (before December 18th), and the rest interviews where held in December, early January, and even February.[15]

Figure 3: Weekly Status



Notes: The count displayed in the y-axis is truncated for better visibility of the interviews, fly-outs, and offers I received. The total number of applications is 250+.

Structure

Assistant professor[16]:

1. Talk about yout JMP (10mins)
2. Research agenda (10mins)
3. Teaching experience (5mins)
4. Why our department? (5mins)

Postdocs: structure depends on the search committee

Example 1:

1. Talk about yout JMP (10mins)
2. Research Agenda in relations to project (5mins)
3. What skill can you bring to a proposed projects (10mins)
4. Why our project? (5mins)

[14] This is way bellow the rate reported by McFall et. al. (2015) where they find people interview for 10-20% of the positions they apply to. However, 80% of their sample comes from a top 50 institutions, pre-COVID times, and with a booming academic job market.

[15] Even some postdoc position sent an interview invitation on January 26th.

[16] I also had an interview in a Gobernemt School, which had a different structure. In less 10 minutes I needed to synthesize my agenda, how it fits with the department, my teaching experience, and lastly why am I a good fit wiht the school.

Example 2*:

1. Present a paper close to the project (15mins)
2. What potential ideas or projects for the agenda? (5mins)
3. Questions (10mins)

**After this type of interview there was no fly-out.*

Industry interviews also vary quite a lot depending on the firm (e.g. consulting or data-science). Mohsen Foroughifar put it best when talking about the Marketing Academic Job in his LinkedIn post.

In my experience interviewing with Analysis Group, they focused more on econometric techniques and on how I defended them than I had expected; in other words, they were stricter about technical skills compare to academic interviews. My first-round interview followed this structure:

1. Talk about yout JMP (15mins)
2. Explain Econ concept to a jury/judge (5mins)
3. What do you like more about the research work? (5mins)
4. Do you have any questions for us? (5mins)

Advice

Do your homework before the interview. When you receive an invitation, answer (usually via email) promptly. I usually asked for the prefered language,[17] and who is going to be present in the interview, so I can research them beforehand. This might give you some insights into what parts of your CV you want to highlight during the interview that most appeal to them. At this stage there is at least one faculty who vouches for you (that you might not know who it is), and you need to win over the rest of the committe.

Get to know the department and institution. Look at their website, their events (if they hold regular seminars or not), any YouTube videos, and groups within the department that might interest you. Go over the faculty and highlight some professors who are closest to you in research and look for "holes" in the department that you can fill (either in teaching and/or research). In my case, most of the departments lack a specialist in AI or Machine Learning, so I made sure to highlight this skill during the interview.

Pay attention of what type of department it is (e.g. pure econ, governement school, business school, etc) and tailor your answers accordingly. For example, for teaching in a business school, I highlighted the practical skills of AI and how it can be used in the industry. For government schools, I hightlighted that my interdisciplinary research can help inform public policy.

Do not have your prefered place as your first interview. You gain experience with each interview. For example, in my first interview I rambled about how I have done a bunch of programming work in the question "We are opening a new Master's program for Data Analytics, would you feel confortable teaching in it?" In other words, I gave a long-winded and convoluted answer instead of a short and direct answer on how my knowledge of AI would be benefitial for the program.

Always start your JMP spiel with a version of the following:

> *I am an `MAIN_FIELD` economist, working in the intersection of `SECOND_FIELD` and `THIRD_FIELD`. My JMP ...*

This helps the committee to place you within the field, and understand better your work.

[17] Some of my interviews were in LATAM, where Spanish is the main language, so I asked if the interview would be in Spanish or English.

> *I am an Applied economist, working in the intersection of Culture and Media. My JMP shows that when women grow up watching female empowered content on TV shows they are more likely to work as an adult ...*
>
> — *Javier Gonzalez*

Treat the interview as a conversation. You need to walk the fine line of having a perfect Job Market spiel combined with the flexibility to answer questions to adapt to the interviewers' interests. The standard advice recommends having 1, 5, and 10-minute versions of your JMP (the "onion"). However, I have found a clear 3–4 minute spiel works best for most interviews.[18] It is short enough to hold attention yet long enough to convey the core contribution, identification, and main results. Practice this version until you can adjust on the fly, because interviewers will often interrupt with questions.[19] Answer briefly, then steer them back to the main points you still want to make. Above all, sound genuinely excited about your research and about joining the department or postdoc project.

Remember that the search committee is looking for a colleague. That means that you should avoid showing yourself as a student, and instead as an independent reseracher. One of the mistakes I did in one interview happened when answering a question about where do I plan to publish my JMP. I answered:

> *... similar papers have been published in Journal of Human Resources, Journal of Labor Economics, and Development Economics and Cultural Change. However, I think it can have a shot at a top 5 if my advisor approves it.*

The mistake was to mention *if advisor approves it*.[20] So avoid mentioning your advisor too much, as it signals that my advisor had a bigger role in my research that I intended.

Practice your interview skills early and often. My own abilities improved dramatically after 7th interview, including mocks. You will make most mistakes in the first few interviews, but you start to learn to control your nerves, and refine your answers. Ask your department to organize mock interviews with faculty, talk with seminar speakers when possible, and practice with peers who are also on the market. The American Society of Hispanic Economists (ASHE) sometimes offers mock interviews as well.

Concrete evidence of what you have already done is a far stronger signal than what you plan to do. In other words, you are allowed to **brag** about your relevant accomplishments. Mention your published papers and working papers before discussing your research agenda. If you are already working on an idea, describe it and talk about next step. You might also want to mention work in progress from prominent faculty you are collaborating with. If you have teaching experience as an instructor, tell them which course, level (undergraduate/graduate), and any evaluation scores you received. I would also suggest you mention your experience as a teaching assistant at SMU and on your previous institution.

When answering "*Why our department/project/firm?*" personal reasons rather are more important than professional ones. Committees want to know you will be committed to living and working in their country and community. Briefly explain concrete personal motivations (for example, that you want to live in Europe rather than the U.S.) and add a concise reason to make the motivation believable and to complement the professional fit.

These are some of the examples I used:

- Family objectives (e.g. what do we want for our newborn daughter)

[18] The 1-min spiel is particularly useful for conferences where you potentially meet multiple people in a short period of time.

[19] In my experience, they waited until the last concluding paragraph to interrupt me (think around the 3-minute mark)

[20] My reasoning was that my advisor is my biggest critic. It is commom that junior researchers don't know where to send their paper, but in an interview it might be a red flag.

- Have *relatively close* family in the area
- Co-authors or alumni in your network are in the area

> *I want my newborn daugther to grow up immersed in the Latin American culture ... I also have two SMU alumni living in the city ...*
>
> — *Javier Gonzalez*

When they ask if you have any questions, say that you don't have any questions right now. But, you will reach out if any question comes up and comment on your excitement for the position.[21] Some of my attempts to show that I did my research before the position:

> *The videos introducing the department to undergraduate has good production value ...*
>
> *The research agenda of the postdoc is exciting because of ...*
>
> *I saw that the university is building a new building which suggests ...*

If you are in an industry or consulting interview, do ask questions I mainly asked about the specifics of the position or job in my interview with Analysis Group:

> *What does a Associate (Generalist) mean?*
>
> *How much autonomy will I have to take cases?*
>
> *Are there cases of new hires who failed to build up a reputation?*

Send a short thank you email a day after the interview to the people who interviewed you. Try to make them a bit more personal by mentioning something specific from the interview. If you made a mistake in the interview, you can use this opportunity to correct it or clarify an answer you were not happy with.[22] Remember to reiterate your excitement for the position.

Most of the interviews will be online, make sure to have a good quality webcam and microphone. Claudia Golding and Lawrence F Katz have some good tips in how to do a great Zoom interview. Ben Golub and Shengwu Li has some tips on how to set up your environment for online interviews.

Keep both your website AND the department's website about job market candidates updated! Interviewers will either use your website or the department's website to prepare for the interview. This might happen because the department's website is higher ranked in Google search results, than your website.[23] In my experience, during a fly-out interview the professor was looking at the department's website rather than mine and had older information.

IMPORTANT: If you are female, it is **ilegal** for any search committee to ask you about your family plans during the interview.[24] They might infer this information from other questions, but you are not obligated to answer these type of questions. Always be polite, and if you feel uncomfortable with any question, you can always deflect it or say that you prefer not to answer it. Remember that some people in search committees might want to discriminate agaisnt you if you plan to have children in the near future, so be mindfull on what information you want to disclose.

[21] Recommended by Francisca Antman and David Schindler.

[22] This happened in almost all of my interviews, and I feel they appreciated the clarification.

[23] This is why they recommend to generate a lot of traffic to your personal website with your existing social network. That way, when committee search for your proflie with "FIRST_NAME LAST_NAME econ" you want to appear in the first results.

[24] At least for E.U. institutions.

Waiting

Regularly communicate with your advisor. They will know the best strategy to move forward. They might be willing to help you giving mock interviews or give you some advice on how to answer specific questions. They can also help you to manage your nerves during this stressful time.

You will only hear back from those institutions that will invite you to a fly-out, at least according to John Cawley's guide. They should typically let you know within 1-2 weeks after the interview. Some institutions might not let you know, so ask your advisor when it's the appropiate time to reach out for an update. In my case, I had to reach out to one institutions for an update after 3-4 weeks of no updates.[25] Where they commented that I was *waitlisted* for a fly-out, which can either be true, or just a nice way to say that I was not invited to a fly-out.

If more than 2 weeks have passed since your interview, you can reach out to the contact person (usually the admin or the chair of the committee) to ask for an update on the status of your application.

Same advice applies as before. Prioritize your mental health and **avoid** EconJobRumors.

I also suggest that you try to be a little bit productive during this waiting period. This does not mean that you have to solely work on your JMP or dissertation. I for instance, didn't get a lot of free time to do some work, outside of preparing and polishing my job market talks. So I instead used this period to catch up in some of the literature. That is, to review again papers that central and most related to your work, or to skim to through some working papers. You never know when you will need to keep on top of the literature for the interviews or fly-outs. In one particular fly-out, I cited 2-3 of these new papers which related to my work that I did not have the JMP bibliography.

[25] There was the holiday break in between, so I waited until mid January to reach out.

Fly-outs

Congrats! You made it to the final stage. Getting a fly-out invitation means that you are a finalist, but you are still competing with other 5-6 candidates for the position. To put things into perspective, I was competing with candiates from Standford, UC Berkeley, Minnesota, Northwestern, and UT Austin (all top U.S. schools) for a fly-out in a LATAM high ranked econ. department.

I got several fly-out invitations. Two AP position in LATAM and several postdocs in Australia, France, and Switzerland. This ends up being a XX% conversion rate from interviews to fly-outs.[26]

calculate this conversion rate

Note that for Postdocs, the fly-out stage is often skipped. They either just inteview you, or make you do a preentation to understand your research agenda.

The fly-out invitations came around 1-2 weeks after the interview.[27] Note that some institutions might take longer because of the Holiday break in late December. If you have not heard back after 2 weeks, reach out to the contact person for an update. But most likely is that you were not selected for a fly-out.

Typically these the fly-outs should happen in January or February.

Structure

Assistant Professor:

It's a whole day event. You will arrive the day before. The day of the fly-out you will have 1-1 meetings with faculty (around 30mins each), grab lunch with those other faculty, present your JMP to the whole department (45-60mins), and finally have dinner with some faculty.

Although the lunch and dinner are informal settings, you should still treat them as part of the fly-out and be on your best behavior. At the end of the day, they are searching for colleagues, so you want to show that you can fit in the department culture.

In my experience, the whole day is tirering, with meetings back to back and little time to rest and go to the bathroom. In the interviews I expected to receive technical questions about my work, but in most it was along the lines of "*You are doing cool research, here what I'm doing ...*" And in some cases, the interviews are about *selling* the department to you. You will meet with some senior professors which you can learn more about the institutional details (e.g. teaching load, research support, tenure track requirements, service, etc). I tried to squeeze personal questions (e.g. where does faculty usually live, how is the city, etc) in these meetings when the conversation died down. My seminar was planned during lunch time, and the next couple of interviews where mostly about my JMP with more technical discussions. I also had an *odd* interview, where a professor asked me about a sleeping project quite unrelated to research agenda. So you have to be prepared to talk about any project that you put on your CV or website. After 6pm, I had dinner with 2 faculty members that have a similar situation to mine, "young" married with a baby or toddler. So I tried to fit in all my personal questions in this more informal. Overall, the day was long but manageable.

Since COVID, some institutions have moved to a online fly-out, where you sit down on your computer, as if you are in person, and follow a similar schedule with out a dinner. This is mainly due to budget constraints in the department, where if most candidates are in the US, and they are an Argentinian instituion, flying out 5 candidates can get pretty expensive. However, most institutions will fly you out to their campus shortly before making an offer.

[26] This rate is similar to what McFall et. al. (2015) found.

[27] One of my fly-out invitations came on the same week. However, the did mention they wanted to finish the search before February.

In my case, I did one online fly-outs for a Gobernment School, which had a different structure than a typical econ. school. Where in an hour and a half I presented my research agenda (10mins), my JMP (30mins), and then had a Q&A with the committee (50mins). Most of the question were related to my JMP, and some linked both my JMP with my research agenda.

Postdoc

No common structure here and will depends on the projects/team.

Example 1: present my JMP in 1 hour to the team (4 people).

Example 2: no fly-out and skipped to the offer stage.

Advice

As soon as you get a fly-out invitation, tell your advisor. Politics now play a huge role and you want to send the best signals possible to maximize your offer chances. Your advisor will help you navigate this process.

Here there will be more logistic to take into consideration. When to select the date, travel arrangements, accomodations, etc. Be sure to have a credit card with you to pay for travel, as reimbursement might take some time.

Similar to the interviews, do not have your prefered place first. You gain experience and practice with each fly-out. Note however that sometimes the timing is not with you. That said do not chose a far away date, so that the committee does not think you want to fish for other opportunities

I was suggested to always arrive a day before the fly-out invitation and hopefully morning or midday This is to not have time pressure if you miss a connection or flight. At the end the hotel will be payed for the night, so no need to save the department's money here.

Between the interviews and the fly-out you should have your JMP talk down. Practice, practice, practice. I cannot stress this enough. By the time of my first fly-out, I had presented my JMP 15 times to different audiences. This allowed me to feel comfortable presenting it, and most importantly, comfortable answering questions on the fly. I had anticipated most of the questions thanks previous presentations. Therefore, participate in as many workshops, brownbags, and conferences as possible.

Do not be affraid to ask for the person you are in the interview for 5 minutes to go to the bathroom.

Make sure that you get al your personal/life questions answered during the dinner. This is a more informal space to ask these type of questions after the long day of thinking about research. After all, once you are in a fly-out you are a finalist, and the committee wants to sell you the department.

Buy a clicker, some departments do not have one available and they are relatively affordable. Try to have the presentation on a pendrive, that way you avoid most technical issues. That said, also keep other copies of that presentation in your email, cloud storage, even phone that you can easily access. John Cawley's guide even describes a horror story where the candidate needed to fish for her pendrive in an elevator shute.

A way to scope out your competition is to check the *seminar* series of the department you are flying out to. Candidates will present their work in these seminars and the department need to advertize the events to students and other faculty through public channels. WARNING I do not recocomend to do this before the fly-out because you might get in your own head and it might affect your performance in the fly-out itself.

In this final stage, either on AP position or post-docs, disregard the advice to not ask questions about the prospect. Here asking question showsd that you are interested in the position. Asuming you come from a low ranked school as myself, you need to play the interested card really well, as it can give you

the edge over higher ranked candidates.So ask questions about the organization of the post-doc, the tenure-track requirements, teaching load, salary expectations, how is it to live with your family, easy access to healthcare or childcare, etc.

Once you get the invitation for a fly-out the offers seems to be so close and you start to how would it look like if you accepted an offer from that institution. So you get overly excited about the prospect of moving there. This is normal, and arguably will help you to show your enthusiam while you are in the fly-out. But, it is also normal that you get a sort of reality check when your chances of getting an offer are not as high as you expected. Remember that a fly-out is just the last stage of the process in whch you have control over, but that does not imply that you will have an inminent offer. So know that getting excited is normal as well as beign let down when you do not get the offer.

Waiting

Not going to sugar coat it. This is the worst waiting period. Because silence in this case can mean anything: offer, waiting list for the offer, or just the committee doesn't want to get rid of you in case everyone else bails out. Beign optimistic, it can mean that they have selected you for the position and is just an administrative delay. At the same time, it can also mean that you are not the prefered candidate, but you are the runner-up. Meaning that they are waiting to see if the prefered candidate accepts the offer, and if they don't, they will offer you the position. In this case they have the incentive to keep you waiting and most likely will not tell you any updates. SOme search committees even have the policy of not telling someone that is ranked last in their fly-out list for the position, becuase search committee want insurance against the case of a failed search. So there is a lot of waiting and uncertainty during this period where silence in this last stage that can mean from you got the offer, or if the first round rejects you get it, or we are keeping you in the dark just in case everyone rejects our offer.

However, at this point you did all you can and whether you get an offer or not and at this point is completly out of your control. And statistics might be on our side, McFall et. al. (2015) finds that around the probability of receiving an offer after a fly-out is around 50%.

CAUTION. There is another tool that can help you reason about yoru chance in the silence, which is LLMS. I tried to give all the facts about the interviews and fly-outs to an LLM to guage my chances of an offer. Note that these models are more **optimistic than reality**, but it can give you some reasons as to why there is adelay on the news and maybe suggest when it's the rigth time to reach out for an update. In some cases, it can help to you to understand like institutional constraints, search commmitee's strategy, or the subtle political language of the email exchanges. However, the best information you can get about your status is by asking your contact in the committee or make your advisor contact someone in their network who is part of the same institution to see if they heard a *rumor* about the search status.

To get the best out of the models performance try to follow these tips:

1. On the prompt use this start:

   ```
   I need help to understand the chances of receiving an offer from a fly-out. Please be critical
   in your analysis. Here is the information I have about my interviews and fly-outs: ...
   ```

2. Give all the information without priming for an interpretation (e.g. avoid "X can be a good thing because ...")
3. After the prompt you can always ask it to make a critical review of their reasons/hyphothesis
4. When the models get's a fact wrong, correct it!
5. Try to keep the chats short. If the answers start to be repetitive or does not update with new information, reset the chat by adding the extra info to the starting prompt.

Prioritize your mental health!

My M.A. advisor told me (in the context of Ph.D. applications) the following:

> *All you need to have is one offer. When you get one, you know for sure that you will have a [job] next [academic] year.*
>
> — *Francisco Parro*

Offers

update number of offers

I received XXX offers. Thus the conversion rate from fly-outs from all positions to offers is about YY%.[28]

My first offer came by February 20th and ended it pretty much ended my aplications, as suggested by Figure 2.

Now, I have to bring some bad news for those in lower ranked schools looking for Assistant Professor position. If you reached the fly-out stage and you have competition from higher ranked schools (or even top 10), the committee deems that your research quality is on par with those candidates. However, this is where the marginal gain of prestige really hits you hard. If you signal that you really want to be in that department, that means that you become a *safety* candidate for the committee. In other words, they know that if they make you an offer you will mot likely accept it.[29] In turn, this makes the higher ranked candidates more of a *reach*, taking from the university applications lingo, and the strategy of the committee is to make an offer to the *reach* candidate and if they reject it, then they will make an offer to the *safety* candidate. The reason is simple, they need to tell the university that they had a new hire and "MIT" looks way better than "SMU".[30]

The hardest part of this whole process is to receive the news that they have offered the position to someone else but you where a close second.[31] I understand that this signal quality of my research, but second place does not get you a job, and it is really hard to accept that you were not the prefered candidate for the position. Again, because we are from SMU this is a fact that job market candidates from lower ranked schools will have to face.

There is a sliver of hope for us in lower ranked schools. Prestige doesn't play a role in postdoc positions. They mostly care that you have the skills to contribute to their projects, and that you are a good fit for the team.

The decision of which offer to choose is very personal. However, a key varaible in this decision is the timing. You will likely need to face the trade-off between accepting an offer early, or rejecting a for sure offer in the hope of getting a better one later. This gets further complicated if you receive an offer from a postdoc postion, while in the process of interview/fly-outs to AP positions. In my case, I received a posstdoc postion at a top institution in the EU, but I was still in the process of interviewing for AP positions in LATAM. I decided that I would accept the postdoc offer, even if I had the chance to get an AP position, because the extra research experience and the prestige of the postdoc would increase my chances of getting a better AP position in the next job market cycle in EU.

Rejections at this stage hurt a lot, especially from places I was very excited about and had high hopes. I think there were a couple things that made it easier for me to move on.

First, I notified my family, advisor, and close friends and after talking with them I felt better. They let me voice all my frustration with the process and breaking the news made it materialize more and easier to let go.

Second, I drafted a email to answer to the rejection emails that same day, but I did not send it. The idea is that you stop thinking to much about the rejection and will help you move on. On that same idea, I quickly put the name of the instituion on my CV of Failures which again helped me to not overthink and focus on other processes.

[28] I'm including those postdocs, where I passed the original shortlist and advances to the interview/job talk stage.

[29] I still recommend that you play the card of "I really want to be in this department" because without it you might not even get to the fly-out stage to begin with.

[30] There are other non-observable differences like a conection to the department at MIT rather than SMU, which can also be an strategic play (as higher ranked schools tend to also have editors of top journals, etc).

[31] Yes, even harderd that the waiting part after the fly-out.

Third, I tried to be productive and focus on other processes. At this point, I have already received a montain of feedback for my paper and wanted to implement some of the feedback that would make my paper to be published in a better journal, so I focused on that. Productive does not necessarily mean working on your research, it can be anything that makes you feel good and that you can control. Working out, miniature painting, talkingwith classmates, go n dates with your siginificant other, play with your pets. If you can get outside do it!

Fourth, I disabled email notifications in my phone and limited myself to check my email only once a day, and only after I had done some work on my research. This helped with the anxiety of receiving an email notifcation. At the end of the day, ifyou receive the offer email will always be there for the next time you check your email.

I don't really have any advice for the bargaining stage. Please refer John Cawley's guide and always seek advice from your advisor and committee.

What made my profile attractive?

This is what I think made my profile attractive. That means that I don't have the actual reasons why some professors shortlisted my application for interviews.

Several factors made my profile more attractive than others. First, I was explicit about my willingness to relocate anywhere, which broadened the set of institutions that considered me seriously. I recognize this is a difficult ask for candidates with partners or families; being open to relocation is a signal that you will accept a wider variety of offers, but it also comes with real costs.[32]

Second, my job-market profile emphasized a novel AI-based methodology applied to a traditional economics question. The timing, when many departments were actively exploring applied AI, meant committees were sometimes willing to take a chance on a candidate from a lower-ranked program if the work brought fresh tools and perspectives. This *novel* and popular toolset helped me land the postdoc fly-outs, where they needed researchers with Natural Language Processing skills to contribute to their projects.

Thrid, I was able to have several publications before the job market.

expand pubs point

Finally, strong advocacy from my committee amplified these signals. My advisors actively promoted my work within their networks by making introductions, forwarding my CV, and flagging my job-market paper to colleagues who might be hiring. Those personal endorsements translated into more careful consideration from search committees and, in some cases, direct invites to interview. In combination, explicit geographic flexibility, a timely methodological edge, and proactive committee outreach materially improved how hiring committees perceived my candidacy.

[32] If you and your partner are searching for academic positions, please read John Cawley's section on this topic and read this LinkedIn post from Emma Zang.
