

The Hidden Curriculum of the Econ Job Market

by Javier Gonzalez — ([website](#)) — ([latest version](#)) — 2026-06-02

Despite the abundance of guides, webinars, and official resources, I found that much of the advice for the economics academic job market was shaped by pre-COVID experiences or tailored to candidates from top-ranked institutions. My goal here is to complement the current advice with the experience of a candidate from a lower-ranked school.

Take the advice in this document with a grain of salt, as this is my personal experience on the job market in the 2025-26 cycle as a Ph.D. Economics candidate from Southern Methodist University.

I found the following resources particularly helpful:

- [A Guide and Advice for Economists on the U.S. Junior Academic Job Market 2018-2019](#) by John Cawley (outdated but with useful information)
- [AEA Prep. Job Market Resources](#)
- [AEA JOE Committee on the Job Market](#) videos and documents
- [EJM Informational discussions and webinars](#)
- [European Job Market for Economists \(EJME\)](#) with [Guides for Candidates and workshops](#)
- [Preparing for the academic and nonacademic job market as an applied economics PhD student](#) by Zoe Plakias.
- [So you want to go on the job market](#) blog post by Alex Albright.

The advice in the *Advice* sections are in no particular order.

I did not participate in the *offer bargaining* and the *market scramble* stages, and so I cannot provide firsthand experience from those stages. Please refer [John Cawley's guide](#) and always seek advice from your advisor if you are in any of those stages.

The examples of my answers will be displayed on a *quote* block, so you can easily identify them:

My future research will be dedicated to expanding this methodological pipeline ...

— Javier Gonzalez

This document is somewhat informal, so please excuse any typos, grammatical errors, or unclear phrasing. I will be slowly working on it before August 2026.

Special thanks to [Fernanda Da Silva](#) for encouraging me to write down this document. It also served me as a personal journal to reflect on my own experience, a way to keep my sanity, and keep me occupied in the waiting periods of each stage.

Declaration of generative AI and AI-assisted technologies During the preparation of this work the author used generative AI models (e.g. Gemini and GitHub Copilot) in order to check grammar and spelling, search for related literature, and coding support. After using this tool/service, the author reviewed and edited the content as needed and take full responsibility for the content.

Preparing Applications

The econ job market is a grueling marathon.

It “starts” in the summer before the market opens (June or July), when you need to assess if you are ready for the market and if you want to participate in the next cycle. Talk with your advisor and committee members to determine if you are ready.

Your Job Market Paper should be finished by August, before the market. This means a *polished* draft with all the figures, tables, and analyses ready.

In September, you will start preparing the material so that you are ready to send hundreds of applications and your letter writers have enough time to write you strong letters of recommendation.

October and November will be spent sending applications. You will have zero time to work on your JMP during this period. In my case, I had my firstborn daughter in September, which served as a good commitment device to have everything in order before her arrival.

December is when you will have the bulk of your interviews.

By January and February, you will be waiting and doing fly-outs.

Lastly, by February and March you should have some offers, where you need to decide between them, and most likely forgo some departments that moved slower than you wanted.

This means that the actual market, not counting the preparation, lasts around **6 months**.

It is a **weird** period, with a mix of anxiety and excitement for all the attention your work will receive. You will be anxiously waiting for interviews, fly-outs, and then offers. You might have the opportunity to travel, but with a big job market presentation in mind. All the while, you are in the middle of the end-of-year holidays.¹ And depending on your application strategy, this is also a time when the world seems to be extremely open, but that comes with the uncertainty of not knowing in which country you will end up in the next couple of years.

¹I was invited for an interview on the 23rd and had an interview on the 29th of December.

So it's especially important that you find ways to stay focused. In my case, I had a newborn daughter, which kept my mind somewhat occupied. But this also meant that I couldn't exercise as much as I wanted to, which is my main way to relieve stress. Talking about what I was thinking to my wife helped me stay sane during this period. Journaling also helps, as this document served as a journal of my experience in the market. I would suggest you remember what you did while preparing and waiting for the first-year qualifier results, as you will be in a *somewhat* similar stressful situation.

Lastly, try to give yourself grace. In other words, do not be too hard on yourself if things do not go as planned.² You will have a bad interview, have the worst presentation of your life during a fly-out, or not receive any interview invites before mid-December. You will overthink every little detail of your application package, interview, and fly-out. It's best to accept it, see how you can make a minor improvement, and move on. Remember that practice makes perfect, and other junior candidates are in the same boat as you are.³

Advice

Your network and your advisor's network are key to getting interviews. This is the time to use the network you have been building during your academic career.

Before the market, expand your network strategically by connecting with people who work in the markets you want to target (e.g., Associate Professors in the EU if you want to target the EU market).⁴ Attend regional conferences and workshops to build relationships with faculty who can later tell the hiring committees so they *at least* take a look at your application. For example, if you want to target the Spanish market, prioritize attending the [Simposio de la Asociación Española de Economía \(AEE\)](#) and use that opportunity to meet potential connections in person.⁵ If you

²This is way easier said than done. I myself struggled when I received two second-place updates (that is, the first round of offers went to someone else).

³There are others who will not be in the same boat as you. For a typical Assistant Professor (AP) position, you will also compete with candidates who are in postdocs or more senior AP positions.

⁴Hopefully during the 3rd or 4th year of your Ph.D.

⁵If you are an SMU student, remember that you have a budget for conference travel with the [Graduate Student Travel Grant](#) from the Moody school.

are a Latin American student, consider attending the [Latin American and Caribbean Economic Association \(LACEA\)](#) annual meeting.

How should you start networking at these events? Approach presenters after their talk and ask them a question about their work. These naturally lead to longer conversations. You can also seek out people with similar backgrounds (for example, if you share language, culture, or even region) as a natural way to start a conversation.

Your advisor should be reaching out to their network in places where they have connections and you have applied. [Max Erdemendi's LinkedIn post](#) explains that recognized institutions such as Duke can have a far reach by broadcasting their candidates on LinkedIn or even in the faculty or alumni's network. For smaller or lower-ranked institutions, the reach is limited. This responsibility now falls on your committee, especially your advisor. The best way to approach your advisor is to be direct. Just ask:

"Would you be willing to reach out to your network for those institutions that I am applying to? Where do you have connections? Which ones are you willing to contact on my behalf?"

They will then let you know if there are some limitations to whom/where they can reach out. Don't forget to also reach out to your MA advisor or letter writers for the Ph.D. who might be willing to help you.

Make sure your committee and/or letter writers know if you will participate in the market by **September**. *Who should be your letter writers?* [Your advisor should be one of the letter writers](#), and you can choose the other 2 or 3 letter writers. They can be from the committee or not.

Be strategic! Choose people who know you well, can write a strong letter of recommendation, and hopefully describe you in different ways. My letter writers were: (i) my advisor, (ii) a committee member who knew my research well and my work as a research assistant, and (iii) another committee member who could vouch for my teaching skills and experience.

The letter writers need time to write you a good letter. Let them know as early as September, so they can have the letters ready by mid-October. There are three potential ways that they can send the letters (in order of inconvenience for them):

1. They upload the letter directly to the platforms (e.g., AEA JOE, EJM, Interfolio), and you then just select them when applying to each position.⁶
2. They will send the letters to an administrator.⁷ Then you would communicate with this administrator for the best way for them to send the letters. Sometimes you just replace the letter writer's email with the administrator's email in the application platform. Other times, they will require you to send them by email, so you will need to coordinate with the administrator to make sure they send the letters on time.
3. They send you the letters directly, and you upload them to each application. This is the most inconvenient for them, so try to avoid this if possible. Remember that professors are busy people, and during the end of the fall semester they might have many things going on.⁸

Create your academic website early. Use a ready-made template and host it on GitHub Pages to save time and money. Follow the [academicpages](#) guide to get a clean, professional site up quickly. Use an LLM to draft and update content instead of learning HTML and CSS from scratch. Display the essential information on the first or landing page (e.g., CV, Job Market Paper, a one-paragraph research summary, and contact information). Keep navigation intuitive, make the site mobile-friendly, and ensure the key documents are one click away. Hiring committees skim hundreds of applications, and any small friction can make the difference between being noticed or overlooked.

Practice your JMP talk in your department, classes, and conferences before the job market season starts. Each presentation helps you understand the common questions your paper raises and will allow you to anticipate these questions, develop concise answers, and project confidence

⁶There is an option in AEA JOE and EJM where each letter writer can assign an administrator, but we found that this was cumbersome, and the best way is just to let them know where they need to upload to these platforms. Make sure they select the option to automatically send the letters to each request in these platforms.

⁷The Graduate Advisor was in charge of this at SMU at that time.

⁸Letters of recommendation are meant to be confidential, so this approach might be uncomfortable for the letter writers.

during potential interviews and fly-outs.⁹ Get practice by presenting at workshops, brownbags, student seminars, conferences, and by running your spiel by seminar speakers, peers, and advisors. There is plenty of material on how to create an effective research presentation, so I will not go into details here. You can find a compilation of [*Advice for PhD Students in Economics*](#) from Chris Roth and David Schindler on the topic of Presentations.

⁹In my case, my JMP raises concerns about reverse causality. The feedback I received from brownbags, workshops, and conferences led me to put this concern in the first two slides to address it as quickly as possible.

Applications

A typical application package includes:

1. Cover letter
2. Curriculum Vitae
3. Job Market Paper
4. Research Statement*
5. Teaching Statement*
6. Letters of Recommendation (usually 3)

** I noticed a shift that most non-US positions do not require Research or Teaching Statements. But these will come up in the interviews, so there is value in writing them.*

There is plenty of advice on how to prepare each of these documents, so I will not go into them here.

For economic academic positions, the main job boards are the [AEA JOE](#) for mostly US positions and the [EJM](#) for international positions, mainly focussed on EU opportunities.

Strategy

I targeted to apply to 308 positions in total. With 213 (69.2%) for Assistant Professor (AP), 57 (18.5%) for Postdocs, and the rest a mixture of Lecturer, Industry, and Non-profit positions.

My strategy was to apply broadly.¹⁰ The academic economics job market is contracting (see [Econ-Jobs.com](#) and [John List's post](#)) with fewer and less predictable openings. Even when a position did not appear to be a good fit (e.g. a finance department instead of economics), I still sent an application. Many departments prefer to hire an outstanding candidate even if they are expert of another related field.

In hindsight, I should have cast my net even wider. My research seems to be appealing to Business or Marketing department that do not necessarily advertise in the EJM or AEA JOE.

¹⁰This was also the advice from almost everyone I talked to about the job market.

Figure 1: Geographical distribution of my applications

Figure 1 shows the geographical distributions of applications of my applications. I sent 51.5% applications to institutions in the U.S. and LATAM, 40.8% to Europe, to Asia (predominantly Japan), some to Australia, and one to South Africa.¹¹

Applications take time. Start early and be organized, specially if you are also targeting 250+ applications. Figure 2 shows the number of applications I sent each day (right axis) and the cumulative timeline of my applications (left axis). I started to work on application materials in early September and sent my first batch of applications by mid-October. You can see that I had days with 10+ applications sent, these were mostly 8 hours of applications with around 10 applications only using the AEA JOE or EJM platforms.¹² However, some institutions also require you to send the application through their own platform, which can be time consuming as you need to re-upload all documents and fill in personal information again.¹³

Create a LinkedIn profile and keep it updated! This will make it easier to autofill some of the personal information required in some of these platforms.

¹¹I purposely avoided applying to any job postings in China and the Middle East. These are places I wouldn't want to move to even if I got the offer.

¹²These platforms make the application process easier as you can upload all your documents once and then just select them for each application.

¹³Most US insitutions use their own platform.

Figure 2: Application Timeline

Notes: The grey vertical lines represent the target deadlines that I sent myself to have a batch of apps ready. The most important deadline is November 15 represented by the solid black line.

The most important deadline for applications is November 15 (solid black line on Figure 2), as many departments have this as their target deadline.¹⁴ I also set up my own target deadlines (grey dashed vertical lines on Figure 2) to have batches of applications ready. The idea is that you target 2-5 days before the advertised target deadline to have some leeway in case of technical issues in the application procedures.

Constantly send applications and should only stop when you accept an offer. Check both JOE and EJM every couple of weeks for new positions. Even with the busy interview/fly-out season of January and February, new positions for postdocs and staggered AP positions can pop up. As you can see in Figure 2, I took a break from applications in January, and in hindsight, it was a

¹⁴This is because most departments, US and EU, go over applications in Thanksgiving break aiming to hold interviews on mid-December.

¹⁵The trigger for this was an awesome AP position in LATAM that I ended up being a runner-up for the offer.

mistake. However, I did restart the applications in late January.¹⁵ In my case, the position which ultimately offered me a job was from a postdoc position that I applied to in February.

Set-up

I used Visual Studio Code to generate *personalized* documents using python and allowed me to modify/export the documents with [typst](#). You can think of typst as a L^AT_EX replacement with modern syntax and instant preview (no need to compile the .typ file every time you want to see a change).

My setup can be divided into three main components:

1. Gather info about job ad, department, and school/project if it is a postdoc
 - This can be time-consuming as you might want to read faculty pages, so take it into consideration
2. Let an LLM read the additional information + CV to create a single paragraph to be at the end of the cover letter to indicate fit with the position
3. Use typst to modify the cover letter template
 - Make sure you get the position and institution right
 - Add personal reasons to apply to that position
 - Modify the LLM-generated paragraph to make it more personal

If you want to see my full setup, please check this [repo](#), in particular the `personalize_docs.ipynb` notebook.

Keep a .txt file with all the extra information you will always copy and paste. In this repo, the file is `other_docs/other_info.txt`.

Advice

In your cover letter, always emphasize the fit with the position. In other words, you need to tailor the cover letter to each position. Personal reasons here are very important. Do not be afraid to **bold** the key phrases that you want the committee to remember about you. Examples:

*As a Spanish national, my family and I are eager to **return to Europe** so our newborn daughter can grow up immersed in European culture. We are seeking a community with a safe learning environment, a key factor in our decision to **leave the United States**.*

*My wife, who is Mexican, and I, a Chilean citizen, are eager to **return to our roots in Latin America**. We want our newborn daughter to grow up immersed in the culture, and our search for a safe learning environment for her is the primary motivation for our move from the United States.*

*My family and I are eager to **leave the United States**. We want our newborn daughter to grow up in a different cultural environment and are seeking a community with a safe learning environment. We are also **willing to learn Japanese** as soon as possible to better integrate into the local culture and academic community*

IMPORTANT: If you are female, you have to think through whether you want to disclose family information in your cover letter, interviews, and fly-outs. In my case, mentioning family signaled that I wanted to leave the US and find a career elsewhere with my family, which most people in the search committee can relate to. Some people who read the same phrase for a female candidate might think that she will need a tenure clock extension or maternity leave in the near future, which might potentially hurt your chances.

You do not need to tailor your Teaching or Research statements. However, you should put effort into preparing these documents. The research statement helps you clarify your research agenda and future plans, while the teaching statement allows you to reflect on your teaching philosophy and experience. Both of these topics **will** come up in your interviews.

Use your signals. Remember that you have 2 signals for the [AEA JOE](#) and 10 signals for the [EJME](#). The common advice here is that you send a signal where your committee does not know anyone and where you think there is a chance they will hire you. In other words, do not waste your signals on MIT, Harvard, Chicago, or top institutions in the EU.

I'm uncertain whether my signals had any impact. The institutions I signaled to did not invite me to interview, which could mean either I chose the wrong targets or these institutions simply don't weigh signals heavily in their decision-making. [David Schindler](#) stated that European institutions do pay attention to the EJME signals.

On the EJM you can link a 1-minute JMP spiel. I uploaded one and it received about 60 views, with over 70% of the views coming from a link on the front page of my website. That exposure generated *some* engagement and the exercise forced me to refine and rehearse a concise 1-minute presentation, which is valuable practice for interviews.¹⁶

Waiting

Resist the urge to check EconJobRumors! You might cave once, but anonymous posts cannot be verified, and small rumors often spiral out of control, making ALL candidates anxious.

Focus instead on more “reliable” sources.

[Econtrack](#) can be informative for AEA JOE listings, but it can sometimes be unreliable because any user can upload a status change. Do not treat its updates as definitive unless an entry is explicitly “verified by an official of this institution”.

The EJM status updates tend to be more reliable and can give you a useful signal about where a search stands for a particular position. For example, when a job shows **“Interview scheduling completed”** status, it usually means the committee will not send out more interview invitations. If you see that status and have not received an invitation, there is a high probability you did not make the cut.

At the same time, a visible **“Scheduling interviews”** without an invitation is likewise a strong signal you did not make the cut.

Some postings remain in **“Reviewing applications”** for long periods, and this does not necessarily imply they will send interview invites soon. As an example, I received a postdoc inter-

¹⁶A viewer appreciated that the video connected to my AI methodology.

view invite from an institution whose EJM status remained in **"Reviewing applications"** until January.

The most reliable information is to ask your advisor if they have a close connection in the institution you want to know about and if they are willing to ask around.

Most positions will not give you any news. I did not receive any updates from 92% of my applications. So if you get to mid-December and the application target deadline has long passed, it is likely that you did not make it to the interview stage.

What if you don't hear anything after mid-December? In the 2025-26 cycle, the [European Job Market for Economists \(EJME\)](#) urged departments to conduct virtual interviews between December 15 and December 18. The [AEA JOE Committee](#) recommended that interviews should be held after December 3, when the signal went out. Therefore, it is likely you did not make it to the interview stage in this first round.

Does this mean that you are doomed? **NO!**

There are three reasons why you can still have a chance. First, the timeline is a little different for postdoc positions. Some might want to wait for the AP positions to finish their matching, so they can pick from the remaining candidates. They have the incentive to do this since, in general, an offer from an AP position is more attractive than a postdoc for candidates. Second, some institutions also wait to send their interview invites. These departments have a similar incentive as postdocs, since an offer from a higher-ranked institution is more attractive. Third, there is a [market scramble](#) where unmatched institutions and candidates can find each other in March. Remember that you need to register to participate in the scramble, so be on the lookout for the registration dates.¹⁷

¹⁷For the 2025-26 cycle, the scramble registration for both institutions and candidates was March 6-12.

Interviews

I got my first interview invite at the end of November for an Assistant Professor (AP) position in LATAM. In total, I have received 13 interview invites (5 AP, 7 Postdoc, 1 Consulting). That means that only 13 out of my 308 applications (4.2%) resulted in an interview.¹⁸ I participated in five interviews virtually in December before the holiday break (before December 18th), and the rest of the interviews were held in December, early January, and even February.¹⁹

Notes: The count displayed in the *y*-axis is truncated for better visibility of the interviews, fly-outs, and offers I received. The total number of applications is 250+.

¹⁸This is way below the rate reported by [McFall et. al. \(2015\)](#), where they find people interview for 10-20% of the positions they apply to. However, 80% of their sample comes from top 50 institutions, pre-COVID times, and with a booming academic job market.

¹⁹Even some postdoc positions sent an interview invitation on January 26th and I did an interview on December 29th.

Structure

*Assistant professor*²⁰:

1. Talk about your JMP (10mins)
2. Research agenda (10mins)
3. Teaching experience (5mins)
4. Why our department? (5mins)

Postdocs: structure depends on the search committee

Example 1:

1. Talk about your JMP (10mins)
2. Research Agenda in relation to project (5mins)
3. What skills can you bring to proposed projects (10mins)
4. Why our project? (5mins)

Example 2*:

1. Present a paper close to the project (15mins)
2. What potential ideas or projects for the agenda? (5mins)
3. Questions (10mins)

After this type of interview there was no fly-out.

Industry interviews also vary quite a lot depending on the firm (e.g., consulting or data-science). [Mohsen Foroughifar](#) put it best when talking about the Marketing Academic Job in his [LinkedIn post](#).

In my experience interviewing with [Analysis Group](#), they were stricter about technical skills compared to academic interviews. My first-round interview followed this structure:

1. Talk about your JMP (15mins)
2. Explain Econ concept to a jury/judge (5mins)

²⁰I also had an interview in a Government School, which had a different structure. I needed to synthesize my agenda, how it fits with the department, my teaching experience, and lastly why am I a good fit with the school in less than 10 minutes.

3. What do you like most about the research work? (5mins)
4. Do you have any questions for us? (5mins)

Advice

Do your homework before the interview. Reply shortly after you receive an invitation, this will signal your interest and engagement. I usually asked for the preferred language, and who is going to be present in the interview, so I can research them beforehand.²¹ This might give you some insights into what parts of your CV you want to highlight during the interview that most appeal to them. At this stage, there is at least one faculty member who vouches for you, and you need to win over the rest of the committee.

Get to know the department and institution. Look at their website, their events (if they hold regular seminars or not), any YouTube videos, and groups within the department that might interest you. Go over the faculty and highlight some professors who are closest to you in research and look for “holes” in the department that you can fill (either in teaching and/or research). In my case, most of the departments lack a specialist in AI or Machine Learning, so I made sure to highlight this skill during the interview.

Pay attention to what type of department it is (e.g., pure econ, government school, business school, etc.) and tailor your answers accordingly. For example, for teaching in a business school, I highlighted the practical skills of AI and how it can be used in the industry. For government schools, I highlighted that my interdisciplinary research can help inform public policy.

Do not have your preferred place as your first interview. You gain experience with each interview. For example, in my first interview I rambled about how I have done a bunch of programming work in response to the question “We are opening a new Master’s program for Data Analytics, would you feel comfortable teaching in it?” In other words, I gave a long-winded and convoluted answer instead of a short and direct answer on how my knowledge of AI would be beneficial for the program.

²¹Some of my interviews were in LATAM, where Spanish is the main language, so I asked if the interview would be in Spanish or English.

Always start your JMP spiel with a version of the following:

I am an MAIN_FIELD economist, working in the intersection of SECOND_FIELD and THIRD_FIELD. My JMP ...

This helps the committee to place you within a field, and set correct expectations.

I am an Applied economist, working in the intersection of Culture and Media. My JMP shows that when women grow up watching female empowered content on TV shows they are more likely to work as an adult ...

— Javier Gonzalez

Treat the interview as a conversation. You need to walk the fine line of having a perfect Job Market spiel combined with the flexibility to answer questions to adapt to the interviewers' interests. The standard advice recommends having 1, 5, and 10-minute versions of your JMP (referred to as the *onion* method). However, I have found a clear 3–4 minute spiel works best for most interviews.²² It is short enough to hold attention yet long enough to convey the core contribution, identification, and main results. Practice this version until you can adjust on the fly, because interviewers will often interrupt with questions.²³ Answer briefly, then steer them back to the main points you still want to make. Above all, sound genuinely excited about your research and about joining the department or postdoc project.

Remember that the search committee is looking for a colleague. That means that you should avoid showing yourself as a student, and instead as an independent researcher. One of the mistakes I did in one interview happened when answering a question about where do I plan to publish my JMP. I answered:

²²The 1-min spiel is particularly useful for conferences where you potentially meet multiple people in a short period of time.

²³In my experience, they waited until the last concluding paragraph to interrupt me (think around the 3-minute mark)

... similar papers have been published in Journal of Human Resources, Journal of Labor Economics, and Development Economics and Cultural Change. However, I think it can have a shot at a top 5 if my advisor approves it.

The mistake was to mention *if my advisor approves it*.²⁴ So avoid mentioning your advisor too much, as it signals that your advisor had a bigger role in your research than intended.

Practice your interview skills early and often. My own abilities improved dramatically after 7th interview, including mocks. You will make most mistakes in the first few interviews, but you start to learn to control your nerves, and refine your answers. Ask your department to organize mock interviews with faculty, talk with seminar speakers when possible, and practice with peers who are also on the market. The [American Society of Hispanic Economists \(ASHE\)](#) sometimes offers mock interviews as well.

Concrete evidence of what you have already done is a far stronger signal than what you plan to do. In other words, you are allowed to **brag** about your relevant accomplishments. Mention your published papers and working papers before discussing your research agenda. If you are already working on an idea, describe it and talk about next step. You might also want to mention work in progress from prominent faculty you are collaborating with. If you have teaching experience as an instructor, tell them which course, level (undergraduate/graduate), and any evaluation scores you received. I would also suggest you mention your experience as a teaching assistant at SMU and on your previous institution.

When answering “*Why our department/project/firm?*” personal reasons are more important than professional ones. Committees want to know you will be committed to living and working in their country and community. Briefly explain concrete personal motivations (for example, that you want to live in Europe rather than the U.S.) and add a concise reason to make the motivation believable and to complement the professional fit.

²⁴My reasoning was that my advisor is my biggest critic. It is common that junior researchers don’t know where to send their paper, but in an interview it might be a red flag.

These are some of the examples I used:

- Family objectives (e.g. what do we want for our newborn daughter)
- Have *relatively close* family in the area
- Co-authors or alumni in your network are in the area

I want my newborn daughter to grow up immersed in the Latin American culture ... I also have two SMU alumni living in the city ...

— Javier Gonzalez

When they ask if you have any questions, say that you don't have any questions right now. But, you will reach out if any question comes up and comment on your excitement for the position.²⁵

Some of my attempts to show that I did my research before the position:

- *The videos introducing the department to undergraduate has good production value ...*
- *The research agenda of the postdoc is exciting because of ...*
- *I saw that the university is building a new building which suggests ...*

If you are in an industry or consulting interview, do ask questions I mainly asked about the specifics of the position or job in my interview with [Analysis Group](#):

- *What does a Associate (Generalist) mean?*
- *How much autonomy will I have to take cases?*
- *Are there cases of new hires who failed to build up a reputation?*

Send a short thank you email a day after the interview to the people who interviewed you. Try to make them a bit more personal by mentioning something specific from the interview. If you made a mistake in the interview, you can use this opportunity to correct it or clarify an answer you were not happy with.²⁶ Remember to reiterate your excitement for the position.

Most of the interviews will be online, make sure to have a good quality webcam and microphone. [Claudia Golding and Lawrence F Katz](#) have some good tips in how to do a great Zoom

²⁵Recommended by [Francisca Antman](#) and [David Schindler](#).

²⁶This happened in almost all of my interviews, and I feel they appreciated the clarification.

interview. [Ben Golub and Shengwu Li](#) has some tips on how to set up your environment for online interviews.

Keep both your website AND the department's website about job market candidates updated! Interviewers will either use your website or the department's website to prepare for the interview. This might happen because the department's website is higher ranked in Google search results, than your website.²⁷ In my experience, during a fly-out interview the professor was looking at the department's website with older information.

IMPORTANT: If you are female, it is **illegal** for any search committee to ask you about your family plans during the interview.²⁸ They might infer this information from other questions, but you are not obligated to answer these type of questions. Always be polite, and if you feel uncomfortable with any question, you can always deflect it or say that you prefer not to answer it. Remember that some people in search committees might want to discriminate against you if you plan to have children in the near future, so be mindful on what information you want to disclose.

Waiting

Regularly communicate with your advisor. They will know the best strategy to move forward. They might be willing to help you giving mock interviews or give you some advice on how to answer specific questions. They can also help you to manage your nerves during this stressful time.

You will only hear back from those institutions that will invite you to a fly-out.²⁹ They should typically let you know within 1-2 weeks after the interview. Some institutions might not let you know, so ask your advisor when it's the appropriate time to reach out for an update. In my case, I had to reach out to one institutions for an update after 3-4 weeks of no updates.³⁰ Where they

²⁷This is why they recommend to generate a lot of traffic to your personal website with your existing social network. That way, when committee search for your profile with "FIRST_NAME LAST_NAME econ" you want to appear in the first results.

²⁸At least for EU institutions.

²⁹From personal experience and [John Cawley's guide](#) also mentions this.

³⁰There was the holiday break in between, so I waited until mid January to reach out.

commented that I was *waitlisted* for a fly-out, which can either be true, or just a nice way to say that I was not invited to a fly-out.

If more than 2 weeks have passed since your interview, you can reach out to the contact person (usually the admin or the chair of the committee) to ask for an update on the status of your application.

Same advice applies as before. Prioritize your mental health and **avoid** EconJobRumors.

I also suggest that you try to be a little bit productive during this waiting period. This does not mean that you have to solely work on your JMP or dissertation. I for instance, didn't get a lot of free time to do some work, outside of preparing and polishing my job market talks. So I instead used this period to catch up in some of the literature. You never know when you will need to keep on top of the literature for the interviews or fly-outs. In one particular fly-out, I cited 2-3 of these new papers which related to my work that I did not have the JMP bibliography.

Fly-outs

Congrats! You made it to the fun stage. Getting a fly-out invitation means that you are a finalist, but you are still competing with other 5-6 candidates for the position. To put things into perspective, I was competing with candidates from Stanford, UC Berkeley, Minnesota, Northwestern, and UT Austin (all top U.S. schools) for a fly-out in a high ranked economics department in LATAM.

I got two fly-out invitations for AP positions in LATAM and four for postdocs in Australia, France, and Switzerland. This ends up being a 30% conversion rate from interviews to fly-outs.³¹

Note that for Postdocs, the fly-out stage is often skipped. They either just interview you, or make you do a presentation to understand your research agenda.

The fly-out invitations usually came around 1-2 weeks after the interview.³² Note that some institutions might take longer because of the Holiday break in late December. If you have not heard back after 2 weeks, reach out to the contact person for an update. But most likely is that you were not selected for a fly-out.

These fly-outs typically happen in January or February.

Structure

Assistant Professor:

It's a whole day event.

You will arrive the day before. The day of the fly-out you will have 1-1 meetings with faculty (around 30mins each), grab lunch with those other faculty, present your JMP to the whole department (45-60mins), and finally have dinner with some faculty.

Although the lunch and dinner are informal settings, you should still treat them as part of the fly-out and be on your best behavior. At the end of the day, they are searching for colleagues, so you want to show that you can fit in the department culture.

³¹This rate is similar to what [McFall et. al. \(2015\)](#) found.

³²One of my fly-out invitations came on the same week. However, they did mention they wanted to finish the search before February.

In my experience, the whole day is tiring, with meetings back to back and little time to rest and go to the bathroom. During the 1:1 meetings, I expected to receive technical questions about my work, but in most it was along the lines of “*You are doing cool research, here what I’m doing ...*” And in some cases, the interviews are about *selling* the department to you. You will meet with some senior professors which you can learn more about the institutional details (e.g. teaching load, research support, tenure track requirements, service, etc). I tried to squeeze personal questions (e.g. where does faculty usually live, how is the city, etc) in these meetings when the conversation died down. My seminar was planned during lunch time, and the next couple of interviews were mostly about my JMP with more technical discussions. I also had an *odd* interview, where a professor asked me about a sleeping project quite unrelated to research agenda. So you have to be prepared to talk about any project that you put on your CV or website. After 6pm, I had dinner with 2 faculty members that have a similar situation to mine, young married with a baby or toddler. So I tried to fit in all my personal questions in this more informal. Overall, the day was long but manageable.

Since COVID, some institutions have moved to an online fly-out format. Where you sit down on your computer and follow a similar schedule without a dinner. This is mainly due to budget constraints of non-US institutions, where flying out 5 candidates can get pretty expensive. However, most institutions will fly you out to their campus if they are planning to make an offer.

I did one online fly-outs for a government school, which had a different structure than a typical econ. school. Where in an hour and a half I presented my research agenda (10mins), my JMP (30mins), and then had a Q&A with the committee (50mins). Most of the questions were related to my JMP, and some linked both my JMP with my research agenda.

Postdoc

No common structure here and will depend on the projects/team.

Example 1: present my JMP in 1 hour to the team (4 people).

Example 2: present my JMP as a seminar to economists in the department.

Example 3: no fly-out and skipped to the offer stage.

Advice

As soon as you get a fly-out invitation, tell your advisor. Politics now play a huge role and you want to send the best signals possible to maximize your chances of getting an offer. Your advisor will help you navigate this process.

Since this stage involves travel, there is a lot of logistics involved (e.g., when to select the date, travel arrangements, accommodations, etc.).

Be sure to have a credit card with you to pay for travel, as reimbursement might take some time.

Similar to the interviews, **do not have your preferred place first**. You gain experience and practice with each fly-out. Note, however, that sometimes the timing is not with you. That said, do not choose a far away date, so that the committee does not think you want to fish for other opportunities.

I was advised to always arrive a day before the fly-out invitation and in the morning or midday. This is to avoid any stress if you miss a connection. At the end of the day, the hotel will be paid for the night, so there is no need to save the department's money here.

Between the interviews and the fly-out you should have your JMP talk down. Practice, practice, practice. I cannot stress this enough. By the time of my first fly-out, I had presented my JMP 15 times to different audiences. This allowed me to feel comfortable presenting it, and most importantly, comfortable answering questions on the fly. I had anticipated most of the questions thanks to previous presentations. Therefore, participate in as many workshops, brownbags, and conferences as possible.

Do not be afraid to ask the person you are interviewing with for 5 minutes to go to the bathroom.

Make sure that you get all your personal/life questions answered during the dinner. This is a more informal space to ask these types of questions after the long day of thinking about research.

After all, once you are in a fly-out you are a finalist, and the committee wants to sell you the department.

Buy a clicker; some departments do not have one available and they are relatively affordable. Try to have the presentation on a pendrive to avoid technical issues. That said, also keep other copies of that presentation in your email, cloud storage, even phone that you can easily access. [John Cawley's guide](#) even describes a horror story where the candidate needed to fish for her pendrive in an elevator chute.

A way to scope out your competition is to check the *seminar* series of the department you are flying out to. Candidates will present their work in these seminars and the department needs to advertise the events to students and other faculty through public channels. **WARNING** I do not recommend doing this before the fly-out because you might get in your own head and it might affect your performance in the fly-out itself.

In this final stage, either in AP positions or postdocs, ask questions! Here, asking questions shows that you are interested in the position. Assuming you come from a low-ranked school like myself, you need to play the interested card really well, as it can give you the edge over higher-ranked candidates. So ask questions about the organization of the postdoc, the tenure-track requirements, teaching load, salary expectations, how it is to live with your family, easy access to healthcare or childcare, etc.

Once you get the invitation for a fly-out, the offers seem to be so close and you start to imagine how it would look if you accepted an offer from that institution. So you get overly excited about the prospect of moving there. This is normal, and arguably will help you to show your enthusiasm while you are in the fly-out.

But it is also normal that you get a sort of reality check when your chances of getting an offer are not as high as you expected. Remember that a fly-out is just the last stage of the process in which you have control. That does not imply that you will get an offer. Getting excited is normal, as well as being let down when you do not get the offer.

Waiting

Not going to sugarcoat it. This is the worst waiting period.

Silence in this case can mean anything: offer, waiting list for the offer, or just the committee doesn't want to get rid of you in case everyone else bails out. Being optimistic, it can mean that they have selected you for the position and it is just an administrative delay. At the same time, it can also mean that you are not the preferred candidate, but you are the runner-up. The last case is that they want to keep you waiting and most likely will not tell you any updates. There is a lot of waiting and uncertainty during this stage.

At this point you did all you can and whether you get an offer or not is completely out of your control. And statistics might be on your side, [McFall et. al. \(2015\)](#) finds that the probability of receiving an offer after a fly-out is around 50%.

CAUTION. LLMs could be an interesting tool to help you gauge the chances of getting an offer. I tried to give all the facts about the interviews and fly-outs to an LLM to gauge my chances of an offer. Note that these models are more **optimistic than reality**, but they can suggest reasons for delays and when to request updates. However, the best information comes from asking your contact in the committee or having your advisor reach out to someone at the institution to learn the actual search status.

To get the best out of the model's performance, try to follow these tips:

1. On the prompt use this start:

I need help to understand the chances of receiving an offer from a fly-out. Please be critical in your analysis. Here is the information I have about my interviews and fly-outs: ...

2. Give all the information without priming for an interpretation (e.g. avoid "X can be a good thing because ...")
3. After the prompt you can always ask it to make a critical review of their reasons/hypotheses
4. When the model gets a fact wrong, correct it!

5. Try to keep the chats short. If the answers start to be repetitive or do not update with new information, reset the chat by adding the extra info to the starting prompt.

Prioritize your mental health!

My M.A. advisor told me (in the context of Ph.D. applications) the following:

All you need to have is one offer. When you get one, you know for sure that you will have a [job] next [academic] year.

— *Francisco Parro*

Offers

My first offer came on February 20th and pretty much ended my applications, as suggested by Figure 2. Thus, my conversion rate from fly-outs to offers was about 25%.³³ Why did I stop? Because the offer dominated almost all other opportunities, and it came after achieving second place in two of the other processes.

Bad news for those in lower-ranked schools looking for Assistant Professor positions. If you reached the fly-out stage and you have competition from higher-ranked schools (or even top 10), the committee deems that your research quality is on par with those candidates. However, this is where the marginal gain of prestige really hits you hard. If you signal that you really want to be in that department, that means that you become a *safety* candidate for the committee. In other words, they know that if they make you an offer you will most likely accept it.³⁴ In turn, this makes the higher-ranked candidates more of a *reach*, taking from the university applications lingo, and the strategy of the committee is to make an offer to the *reach* candidate and if they reject it, then they will make an offer to the *safety* candidate. The reason is simple: they need to tell the university that they had a new hire and MIT looks way better than SMU when they look for the dean's approval.³⁵

The hardest part of this whole process is to receive the news that they have offered the position to someone else but you were a close second.³⁶ I understand that this is a signal about the quality of my research, but second place does not get you a job. In addition, it is really hard to accept that you were not the preferred candidate for the position. Again, this is a fact that any job market candidate from lower-ranked schools will have to face.

The wildest part is that at this final stage any marginal difference can change the outcome. In the eyes of the committee, the candidates have similar research quality, so their personality, insti-

³³I'm including those postdocs, where I passed the original shortlist and advanced to the interview/job talk stage.

³⁴I still recommend that you play the card of "I really want to be in this department" because without it you might not even get to the fly-out stage to begin with.

³⁵There are other non-observable differences like a connection to the department at MIT rather than SMU, which can also be a strategic play (as higher-ranked schools tend to also have editors of top journals, etc).

³⁶Yes, even harder than the waiting part after the fly-out.

tution prestige, and other non-research related factors can be the difference between an offer and a rejection. For example, just your immigration status can be a deal breaker for some institutions or postdocs, where they could prefer a candidate that the visa process is easier.

There is a sliver of hope for us in lower-ranked schools. Prestige doesn't play a role in postdoc positions. They mostly care that you have the skills to contribute to their projects, and that you are a good fit for the team.

The decision of which offer to choose is very personal. However, a key variable in this decision is the timing. You will likely need to face the trade-off between accepting an offer early, or rejecting an offer in the hope of getting a better one later. This gets further complicated if you receive an offer from a postdoc position, while in the process of interview/fly-outs to AP positions. In my case, I received a postdoc position at a top institution in the EU, but I was still in the process for AP positions in LATAM. I decided that I would accept the postdoc offer, even if I had the chance to get an AP position, because the extra research experience and the prestige of the postdoc would increase my chances of getting a better AP position in the next job market cycle in the EU.

Rejections at this stage hurt a lot, especially from places I was very excited about and had a good chance to receive an offer. I think there were a couple of things that made it easier for me to move on.

First, I notified my family, advisor, and close friends and after talking with them I felt better. They let me voice all my frustration with the process and breaking the news made it materialize more and made it easier to let go.

Second, I drafted an email to answer the rejection emails that same day, but I did not send it. The idea is that you stop thinking too much about the rejection. On that same idea, I quickly put the name of the institution on my [CV of Failures](#), which again helped me to not overthink and focus on other processes.

Third, I tried to be productive and focus on other processes. At this point, I have already received a mountain of feedback for my paper and wanted to implement some of the feedback

that would help my paper be published in a better journal. Productive does not necessarily mean working on your research; it can be anything that makes you feel good and that you can control. Working out, miniature painting, talking with classmates, going on dates with your significant other, playing with your pets. If you can get outside, do it!

Fourth, I disabled email notifications on my phone and limited myself to checking my email only once a day. This helped with the anxiety of receiving updates. At the end of the day, the offer email will always be there for the next time you check your email.

I don't really have any advice for the bargaining stage. Please refer to [John Cawley's guide](#) and always seek advice from your advisor and committee.

What made my profile attractive?

These reflections are educated guesses based on interview invitations and feedback received. I cannot claim with certainty why committees shortlisted my application.

Several factors made my profile more attractive than others. First, I was explicit about my willingness to relocate anywhere, which broadened the set of institutions that considered me seriously. I recognize this is a difficult ask for candidates with partners or families.³⁷

Second, my job-market profile emphasized a novel AI-based methodology. The timing, when many departments were actively exploring applied AI, meant committees were sometimes willing to take a chance on a candidate from a lower-ranked program if the work brought fresh tools and perspectives. This *novel* and popular toolset helped me land the postdoc fly-outs, where they needed researchers with Natural Language Processing skills to contribute to their projects, even if there wasn't a direct match of fields.

Third, I was able to have several publications before the job market. I managed to publish my Master's thesis with the help of my advisor, and I participated in the [Improving Replication in Economics \(I4R\)](#) initiative. This resulted in two publications: a replication study co-authored with my current advisor, and a meta-analysis paper in *Nature* from the I4R games examining patterns across multiple replications. These publications signaled research maturity and collaborative capability to hiring committees. Being open to co-authoring opportunities and academic initiatives can unexpectedly yield publications and visibility that strengthen your job market profile.

Finally, my dissertation committee actively promoted my work within their networks by contacting colleagues who might be on hiring committees at places I applied to. Those personal endorsements translated into more careful consideration from search committees and, in some cases, direct invites to interview. In combination, explicit geographic flexibility, a timely method-

³⁷If you and your partner are searching for academic positions, please read [John Cawley's](#) section on this topic and read this [LinkedIn post from Emma Zang](#).

ological edge, established publication record, and proactive committee outreach were some of the explanations for my performance on the 2025-26 academic economics job market.
